NEW FLOWER NOVELTIES

Marigold-Dwarf Double Firetail

MARIGOLD, NEW FRENCH DWARF DOUBLE

FIRETAIL—This new Marigold is a real early strain and is extra prolific. When in full bloom each plant will produce from 40 to 50 blooms, which are beautifully crested with large guard petals. Firetail has a base color of the richest golden orange with a dozen or so dart or tonguelike reddish scarlet markings shooting up through the waxlike golden orange petals. The color marking and makeup of the bloom resembles little fingers of fire coming through the lighter color of amber coals. The most striking Dwarf Marigold we have seen.

Pkt 25c.

NEW F2 HYBRID PETUNIA COLORAMA

NANA COMPACT MIXED—There is nothing like Colorama on the market. It has four times as many blooms per plant, hybrid vigor, uniform domelike dwarf plant habit. The blooms are large, borne in profusion and incorporate a thrilling riot of vivid colors from pure white, light and medium salmon, warm scarlet, fiery red, light medium pink and rose, with many golden or topaz throats, together with white bicolor crimson rose, blue and dark blue as well as many starred varieties.

The blooms are larger than you would expect to find on such a dwarf compact plant, about 2 inches across. A soft golden yellow with a maroon blotch in the base of each petal. The little crested center is real sharp Margiold-Dainty Marietta and like a yellow tuft

of wax-like petals closely packed with a sprinkling of black pepper. Pkt 25c.

How to Grow Bush Lima Beans

Bush Lima Beans succeed well in almost any good garden soil but do best in a rich, well-drained, sandy loam. As seed is sensitive to cold and wet ground, it must not be planted until the soil has become quite warm and fairly dry. Plant the seeds, edgewise, eye down, 4 in apart in rows 2½ to 3 ft. apart, and cover with 2 in. of fine soil. When the plants are well started, thin to stand 12 in. apart for large-seeded varieties and 8 to 12 in. for small-seeded varieties. Give frequent and shallow cultivation until blossoms appear, but do not cultivate or handle plants when they are wet. They may be eaten green, dried, canned or quickly frozen.

How to Grow Pole Beans

Beans should not be planted until danger of frost is passed and soil is warm. They do best if the vines are given support. Space 3 to 4 ft. apart each way. Place 5 or 6 beans around each pole, cover with 1½ inches of soil, and firm to assist germination. When plants are well started, thin to 4 of the strongest to a pole. A packet of seed for 15 poles, except Scarlet Runner, a packet for 8 poles. Pole Beans may also be planted 3 to 5 inches apart along a trellis or fence.

S. N. & S. Co's. BEANS, Stringless and Tender

S. N. & S. Co's. Peerless Onion Seed

(One ounce for 100 feet of drill; 4 to 5 pounds in drills per acre)

HOW TO GROW ONIONS FROM SEED

Sow seed as early in the spring as the ground can be worked, in rows 1 to $1\frac{1}{2}$ feet apart. Cover the seed lightly. The soil best suited to grow onions is one that is reasonably fertile, well drained, and well prepared. If fully matured onions are wanted, thin the seedlings when 3 to 4 inches tall, to stand sufficiently far apart to develop without touching one another. The largest onions are produced by sowing the seed in hotbed early in January or February and transplanting seedlings to the open ground 6 inches apart. When the bulbs have reached maturity, bend down the tops to hasten ripening before the onions are harvested. Store in a dry, free-from-frost place over winter.

Functional Parts of Bradson Sprayers (and only Bradson) Will Not Pit, Corrode or Disintegrate. The exclusive molded Nylon spray heads plus Polyethylene gaskets and suction tubes withstand new insecticides and fertilizers that pit, corrode and destroy metals and commoner plastics.

Controlled Spray Pattern Gives Best Performance. The controlled fan shaped spray patterns of Bradson Sprayers eliminates side spray, most effectively mixes and distributes spray material at point of application. Fertilizer sprayers give 3 to 6 times the coverage at same water pressures.

Controlled Vacuum Results in Large Non-Clogging Suction Holes. Exclusive Bradson "Hydro-Lift" design produces a controllable vacuum, eliminates small easily clogged suction holes inherent in other sprayers. Bradson Suction Holes are Five Times Larger.

Michigan Peat * It's Bacti-vated!

"NATURE'S FINEST SOIL BUILDER"

What Is the Value of PEAT in Gardening?

Peat is organic matter. As it decays it releases beneficial bacteria. It increases the capacity of soil to retain moisture. When mixed into soil peat gives it the ideal physical structure for growth of plant life. Physical structure of the earth is just as vital to growing things as plant food. Peat binds sandy soils, loosens clay soils, improves all soils. Peat makes fertilizer more effective by storing it up in tiny fibrous cells and then releasing it slowly to plant roots. Used as a mulch in summer, peat keeps the ground from caking and makes cultivation unnecessary. It keeps roots cool and moist during intense heat.

Why is "Bacti-vated" MICHIGAN PEAT a Vitalizing Force in Soil?

Michigan Peat is aerated and processed to build up its naturally high count of beneficial bacteria. This bacteria converts raw chemical fertilizers into a form that sidigestible to plant roots. Helps to release plant food lock up in soil.
